

Newity Loan Matcher

Product Requirements Document

Owner: Abhilash Tripathy (AB) · Status: Approved v1 · Date: Oct 1, 2026

1. Problem

Sales reps (SDRs) take inbound calls from small-business owners who want SBA loans. During the call, the rep has to match the customer to the right loan product. The lender program data is spread across browser tabs, emails, printouts and CSVs. Even the organized CSVs are bad for comparing one customer against dozens of products while that customer waits on the line.

This causes three problems:

- **Slow, error-prone matching.** Reps dig for information mid-call and may miss a better-fit product.
- **Lost momentum.** The customer is engaged during the call. If the follow-up arrives later, some of that interest is gone.
- **No visibility.** Sales managers can't see which products get recommended, which ones customers weigh against each other, or whether a rep favors certain products.

2. Users

User	Need
Sales rep (SDR)	Take intake on a live call, see every matching product ranked, explain the fit, and email options before hanging up.
Sales manager	See which products are recommended and compared, and by which reps.

3. Goals

1. The rep sees all matching information at once and can sort it by what the customer cares about.
2. The rep can email the customer a recommendation or comparison while the call is still live.
3. Lender data lives in a real relational database, not a flat file.
4. Managers get oversight that starts a data loop ("what gets measured gets better").

4. In scope

4.1 Live call intake and matching (SDR)

- The intake form follows the natural order of a sales script:
 - customer details
 - loan request: amount, purpose, how soon they need funding, desired monthly payment, owner injection
 - business details
 - credit and financials: credit band, cash flow, existing debt payments, bankruptcy in the last 7 years

- The form only asks for fields that a rule or the ranking actually uses. Debt ratio is calculated, never asked.
- All lender programs re-rank on every change into four tiers: **Strong**, **Potential** (one answer away), **Poor** and **Ineligible**. There is no delay during the call.
- Quick priority filters: **Best fit**, **Lowest rate**, **Fastest funding**, **Lowest payment**, **No collateral**.
- Each match shows:
 - why it fits
 - what to watch out for (e.g. “cannot be used for refinancing”)
 - a customer-safe talk track
 - rep-only details

4.2 Compare

- The rep can add up to 4 eligible programs to a side-by-side comparison. These don't have to be top-ranked.
- The comparison highlights the lowest payment, the fastest funding and the total interest.

4.3 Email the customer during the call

- **Email proposal** drafts an email for one program, addressed to the email captured at intake.
- **Send comparison** drafts an email covering all the compared programs.
- The draft is also copied to the clipboard as a fallback.

4.4 Affordability calculator

- The rep enters a hypothetical monthly payment (e.g. “what if I pay \$2,500/mo?”) and sees how much sooner the loan is paid off and how much interest is saved.
- The purpose is to give the customer a stake in the loan by letting them model it themselves.

4.5 Lender data as a relational database

- When a new lender CSV is dropped in, it is imported into normalized tables: lenders, program types, business types, special requirements and programs.
- Each new CSV becomes a versioned snapshot. Old snapshots are kept.
- This makes room for future relationships, analysis and data loops.

4.6 Sales manager oversight

- Every email click is logged: the rep, the programs, and whether it was a proposal or a comparison.
- The manager view shows:
 - sends per program, split into compared vs. sent solo
 - the programs each one is **most compared with** (shows which products customers see as similar)
 - the reps who recommend each one most (shows possible rep bias)
 - filters by month and by rep
- Access is by login, with separate SDR and manager roles.

5. Out of scope (future work)

These are ideas for later, not part of this version:

1. **A real “best fit” definition.** The current best-fit ranking is rudimentary and needs a proper definition.
2. **Better comparisons and priorities.** Improve how products are compared and how priorities are applied.
3. **A less busy matcher page.** Simplify the SDR screen.
4. **SBA-guarantee-based matching.** For customers with weaker credit, search for programs with a higher SBA guarantee (e.g. above 70%). Today the SBA guarantee is shown to the rep only and isn't used for matching.
5. **Business-priority weighting.** Let the business boost certain loan products, for example ones that are better for Newity or improve deal velocity.
6. **A full QA pass on filters and math.** Verify that every filter and calculation is correct.

6. Also not in this version

These come from how the project is built today, not from the transcript:

- Real email sending (today the app opens a draft via mailto:), and submitting loan applications.
- Production-grade auth. The demo accounts use plain-text passwords.
- Full call history (only sends are logged) and a drill-down showing every send.
